

MID3: Agarose gel electrophoresis

9/17/13

1. Lab treat
2. Pre-lab discussion
3. Gel electrophoresis
4. ~3pm: EHS presentation
5. Purify DNA from agarose
6. Evaluate recovery via electrophoresis

Clarification. Figure Caption titles.
Conclusion preview OK!

A few announcements:

1. Notebooks:
 - a. Collection day: MID7
 - b. Text highlights -- for you and for us
 - c. Calculations -- get creative
2. Office hours: Monday 2-3pm (16-429b) & 7-8pm (Lab)
3. Next assignment is submitted to Stellar
4. Waste (as in, please empty).

Step I: Build the system!

Roadmap for Plasmid Construction

Expected product sizes:

$PCR = \sim 650 \text{ bp}$
 $pCX-NNX = 4300 \text{ bp}$

MID3
MID4

DNA Electrophoresis (EP): Principle

Agarose gel

DNA

Agarose and DNA are both *polymers*

Driving force for separation:

electric charge

DNA moves $-$ to $+$ because of

negative charge

Separation is according to:

Size!

smaller

DNA moves faster because

positivity + entanglements

Thanks to Agi for this slide!

DNA Electrophoresis:

Lane	Sample	Volume to load
1^	Uncut pCX-NNX^	10 μL^
2	pCX-NNX Xbal	5 μL
3	pCX-NNX EcoRI	5 μL
4	pCX-NNX Xbal + EcoRI	25 μL
5	1Kb DNA Ladder	20 μL
6	PCR Product Xbal + EcoRI	25 μL
7	PCR Product Uncut	25 μL
8	PCR no-template-control	25 μL

Uncut DNA:

○ plasmid circle
 supercoiled

Cut DNA:

~~~~~

# How do we visualize the DNA?

## Loading Dye:

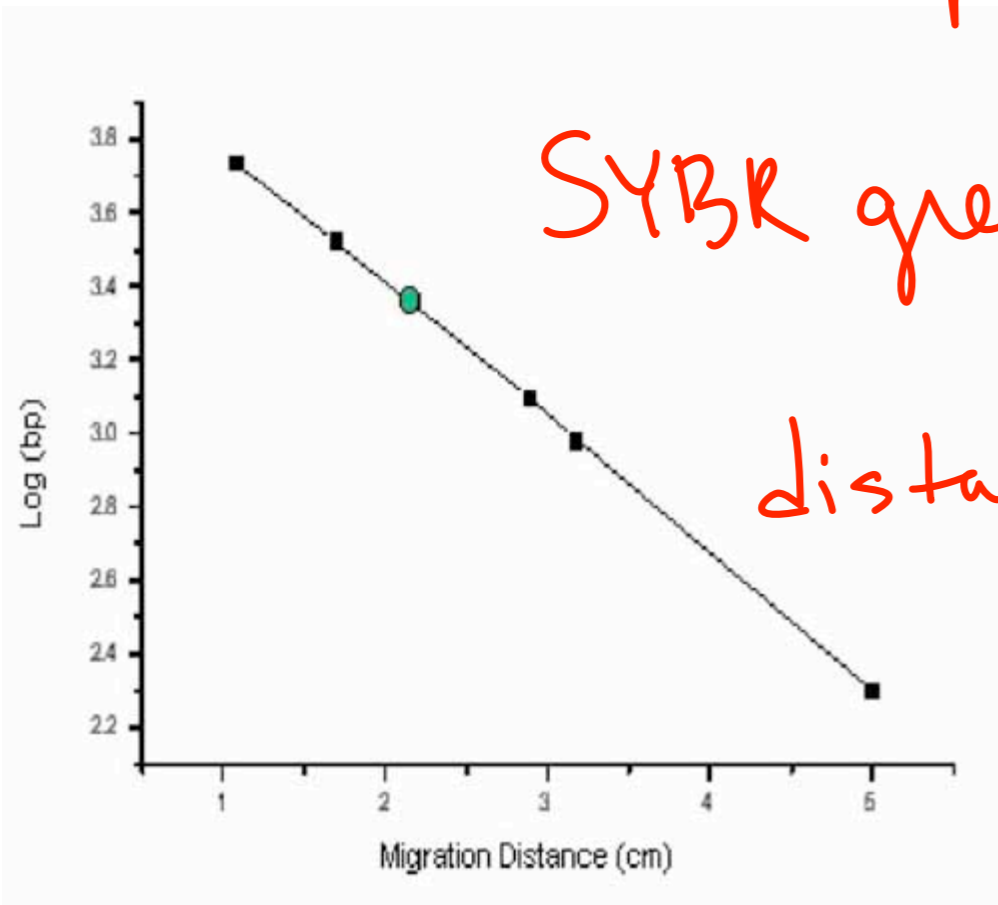

- bromophenol blue
- glycerol / Ficoll-400
- RNase

## DNA stain:

- ethidium bromide
- complexed w/ DNA  $\Rightarrow$  signal

SYBR green

distance  $\propto \frac{1}{\log(MW)}$

# Extract DNA from agarose gel:

Another silica column from Qiagen:

- different salt (yellow)
  - and in melting agarose
- different size silica

**Note:** solution should be yellow. If it turns blue, we'll have to adjust the pH *- unlikely*

**Safety Note:** You must wear *UV glasses* or a *face shield* while cutting out your DNA band.

# DNA EP: clean-up and safety

- Use **nitrile gloves** when handling DNA gels and all equipment used for gels.
- Wear **eye protection/face shields** when cutting DNA bands out of the gel.
- Gels and gel-contaminated papers are disposed of in solid chemical waste.

Thanks to Agi for this slide!

# Next time: DNA Ligation -- some up front work.

*\* With evaluation gel → Recovery after gel extraction*

Dye intensity reflects absolute **mass of DNA**.

mass of DNA ~~≠~~ molar quantity of DNA ???

neb.com: 0.5 ug MW Marker

Goal:

*14 kkb:insert (molar)*

Why?

*Increase chance of success*

*(1) Image gel*

*(2) estimate mass - DNA*

*(3) calc. vol 50-100ng cut plasmid*

*(4) calc. volume of insert*

# Determining optimal backbone:insert ratio:

What happens with a backbone:insert ratio of:

1:100

multiple inserts

100:1

"super plasmid"

1:4 (or slightly increased insert)

- 1:1
  - 1:4
  - 1:6
  - 1:10
- } most common

~~1:100~~ 1:10 - uncut plasmid control

## Today in the lab:

- Gel purify digest reactions -- bring pipettes & samples (no tips) -- 2 groups at a time (white/platinum start) - me
- Cut out bands (safety first!) red/orange - lizzie
- EHS visit ~3pm
- Purify DNA from agarose
- Lizzie runs your evaluation gel

## Next time in the lab (No lab Thursday!):

- Ligations
- Transformation
- Longer FNT
