

A cluster of blue lemons is centered on a light blue background. The lemons are rendered with a textured, slightly bumpy surface and are arranged in a dense, overlapping group. A white rectangular box with a black border is superimposed over the center of the lemons, containing the text.

Engineering a problem-specific bioremediation solution

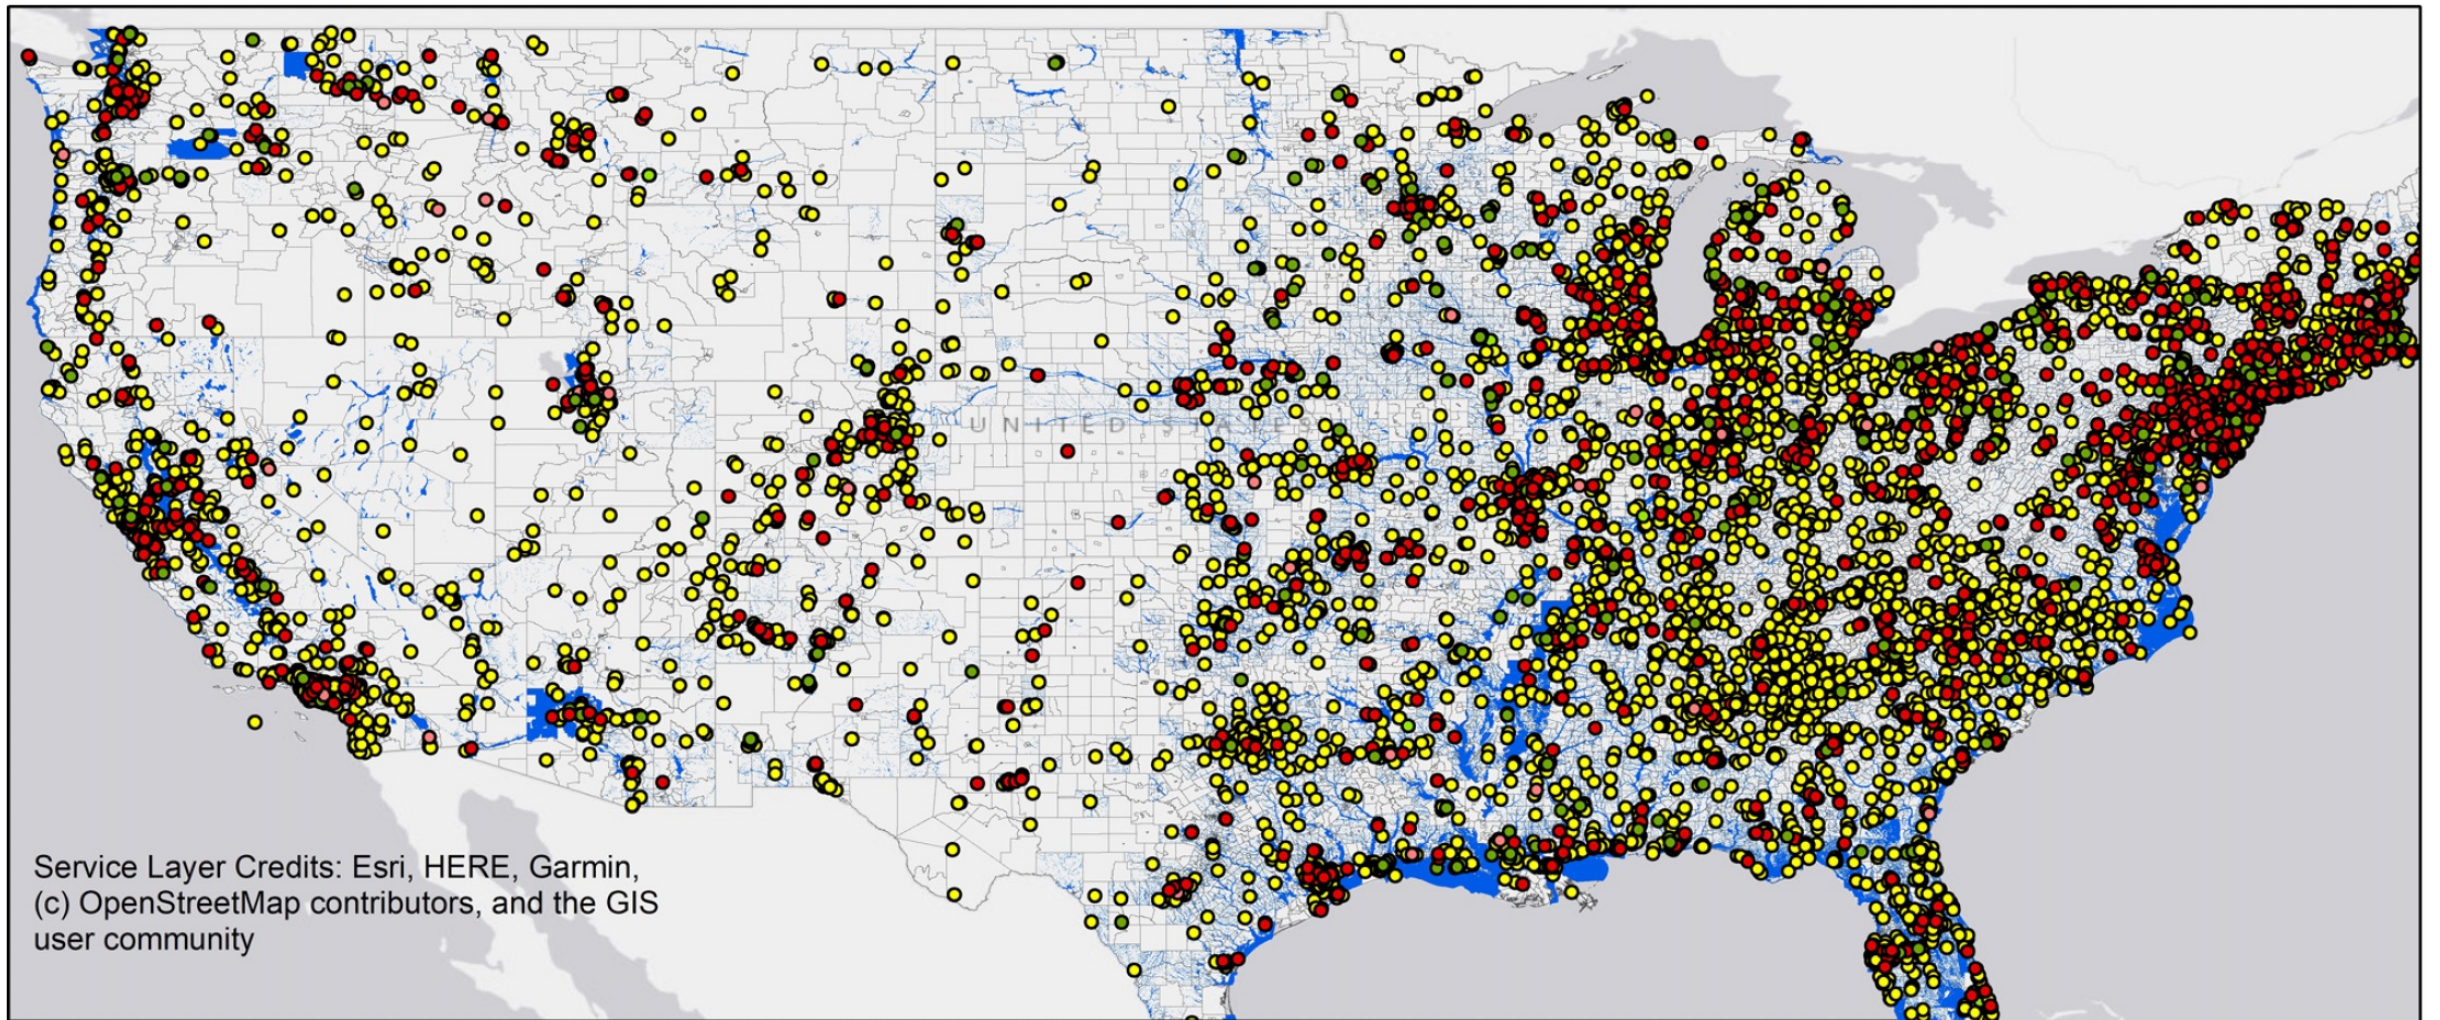

Module Outline

- M2D1: Environmental heavy metal contamination  Intro
- M2D2: Model system – target selection and engineering approach  Design
- M2D3: Model system – choosing a chassis host
- M2D4: Screening a system—assessing features of a bioremediation system  Test
- M2D5: Analysis of elemental metals – laboratory and field approaches
- **M2D6: Engineering a problem-specific bioremediation solution**  Apply
- M2D7: Applying remediation strategies—advantages and pitfalls
- M2D8: Comm Lab  Review

Superfund Sites in the United States

- Locations in the US that have been contaminated with hazardous substances through improper management
- National Priority List (NPL)
- Potentially responsible parties (PRPs)
- Shorter life expectancy is correlated with living near a superfund site
 - Variables like lower socioeconomic status or living near a site that is not being cleaned up increase susceptibility (Kiaghadi et al. 2021)

Legend

 Census Tract (2016)

 Floodplain defined by FEMA

Superfund site NPL status

 Currently on the Final NPL

 Deleted from the Final NPL

 Not on the NPL

 Proposed for NPL

 Removed from Proposed NPL

 Site is Part of NPL Site

 Withdrawn from the Final NPL

Establish information to begin

- Where is the site?
- What metal(s) have been released at the site?
- How were these metals released?
- What has been done to clean up the site so far?

Consider your potential strategy

- If you were to propose a project investigating the potential for bioremediation at the site, how would you handle these parameters? Why?
 1. **Remediation approach** (transformation, accumulation, adsorption, etc...)
 - M2D3 lecture
 2. If you wanted to genetically engineer a system, what class of **target** would you choose? (transporter, enzyme, extracellular proteins)
 - M2D2 lecture
 3. What **chassis** would you use to deploy your remediation system
 - M2D3 lecture
 4. How would you identify **metal** changes?
 - M2D4-M2D5 lectures
- Write down ideas in google doc:
<https://docs.google.com/document/d/1D0lbrg635AM71MvMf-P85xY6R8Xq7brXokqdkYF6kDg/edit?usp=sharing>
