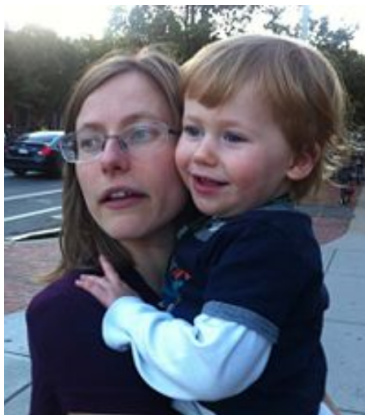
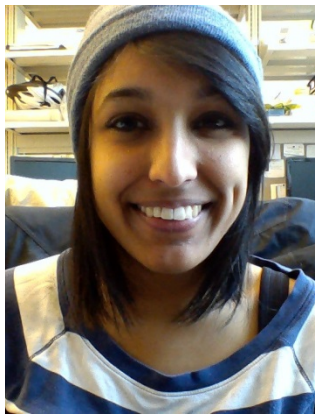
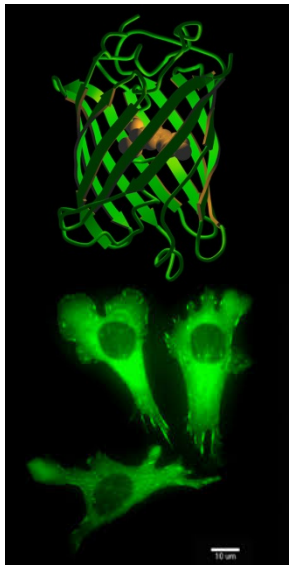
20.109 Spring 2014 Mod 2 – Lecture 6
System Engineering and Protein Foundations





Agi Stachowiak
Shannon Hughes
Aneesh Ramaswamy
Suhani Vora (TA)
Leona Samson (Lectures)
Zachary Nagel (help with development)

What experimental question will you ask in Module 2?



How efficiently does DNA repair by the Non Homologous End Joining (NHEJ) pathway act on DNA damage with different topologies?

This raises the following questions

- How does DNA get damaged?
- What is DNA repair?
- Why does DNA repair exist?
- Why do we care about how efficient DNA repair is?
- How does one actually measure DNA repair efficiency?

CANDIDATE INTERVIEW

June 16th 2009, 8am!

Developing Novel Methods to Measure DNA Repair Capacity in Human Populations

Profiling
Exome Sequencing

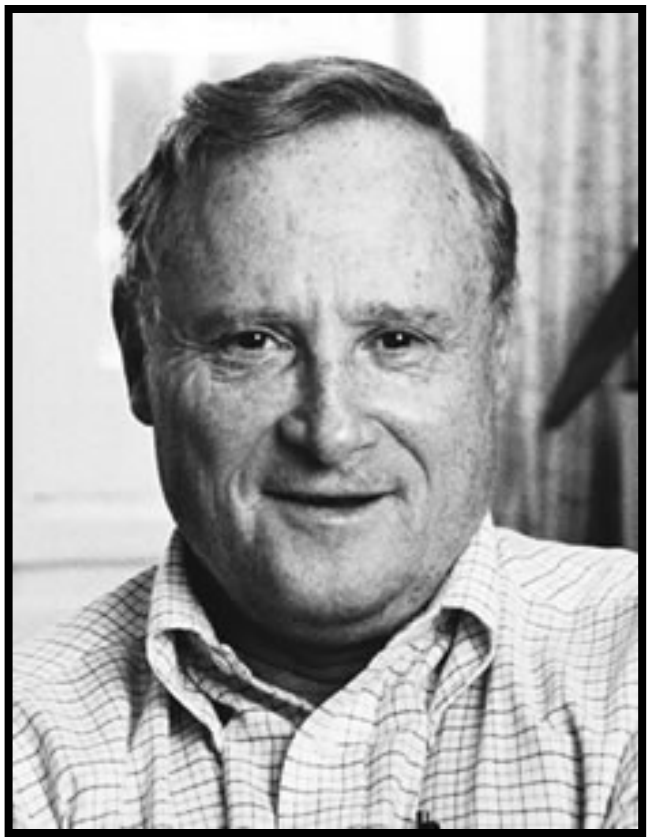
Proteomic Analyses

In vitro / In vivo

FUNCTION

Functional Assays

The Proposal was based on the Pioneering work of:

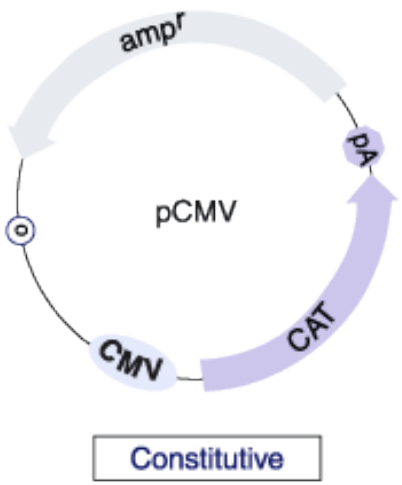


Dr. Lawrence Grossman
(1924–2006)

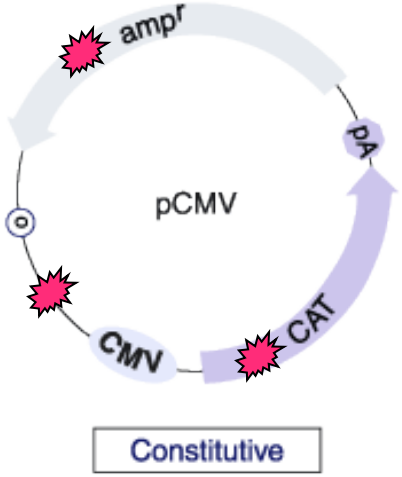
Dr. Qingyi Wei

Reactivation of UV damaged DNA by Host cell Reactivation (HCR)

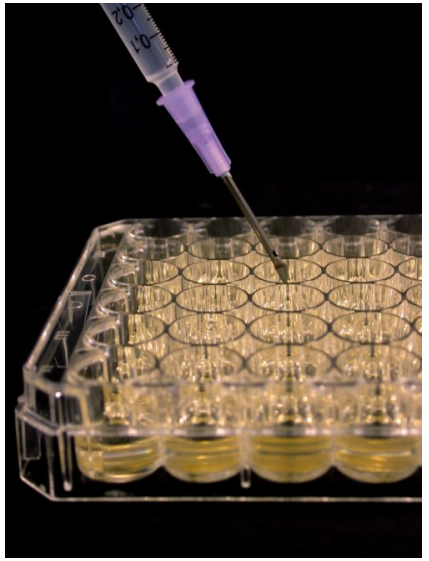
Athas & GROSSMAN
Cancer Res. 1991

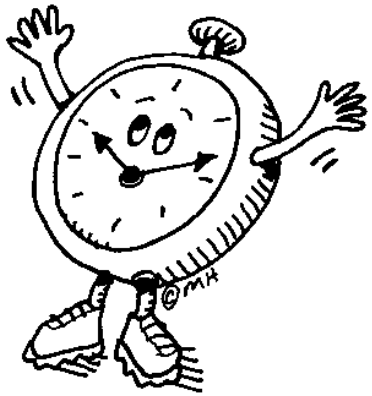


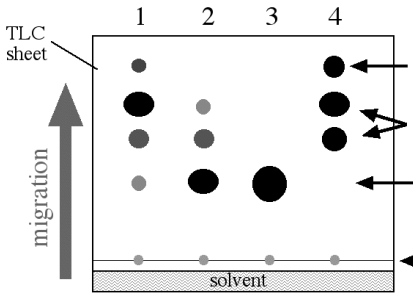
+ UV light



Transient transfection peripheral blood lymphocytes

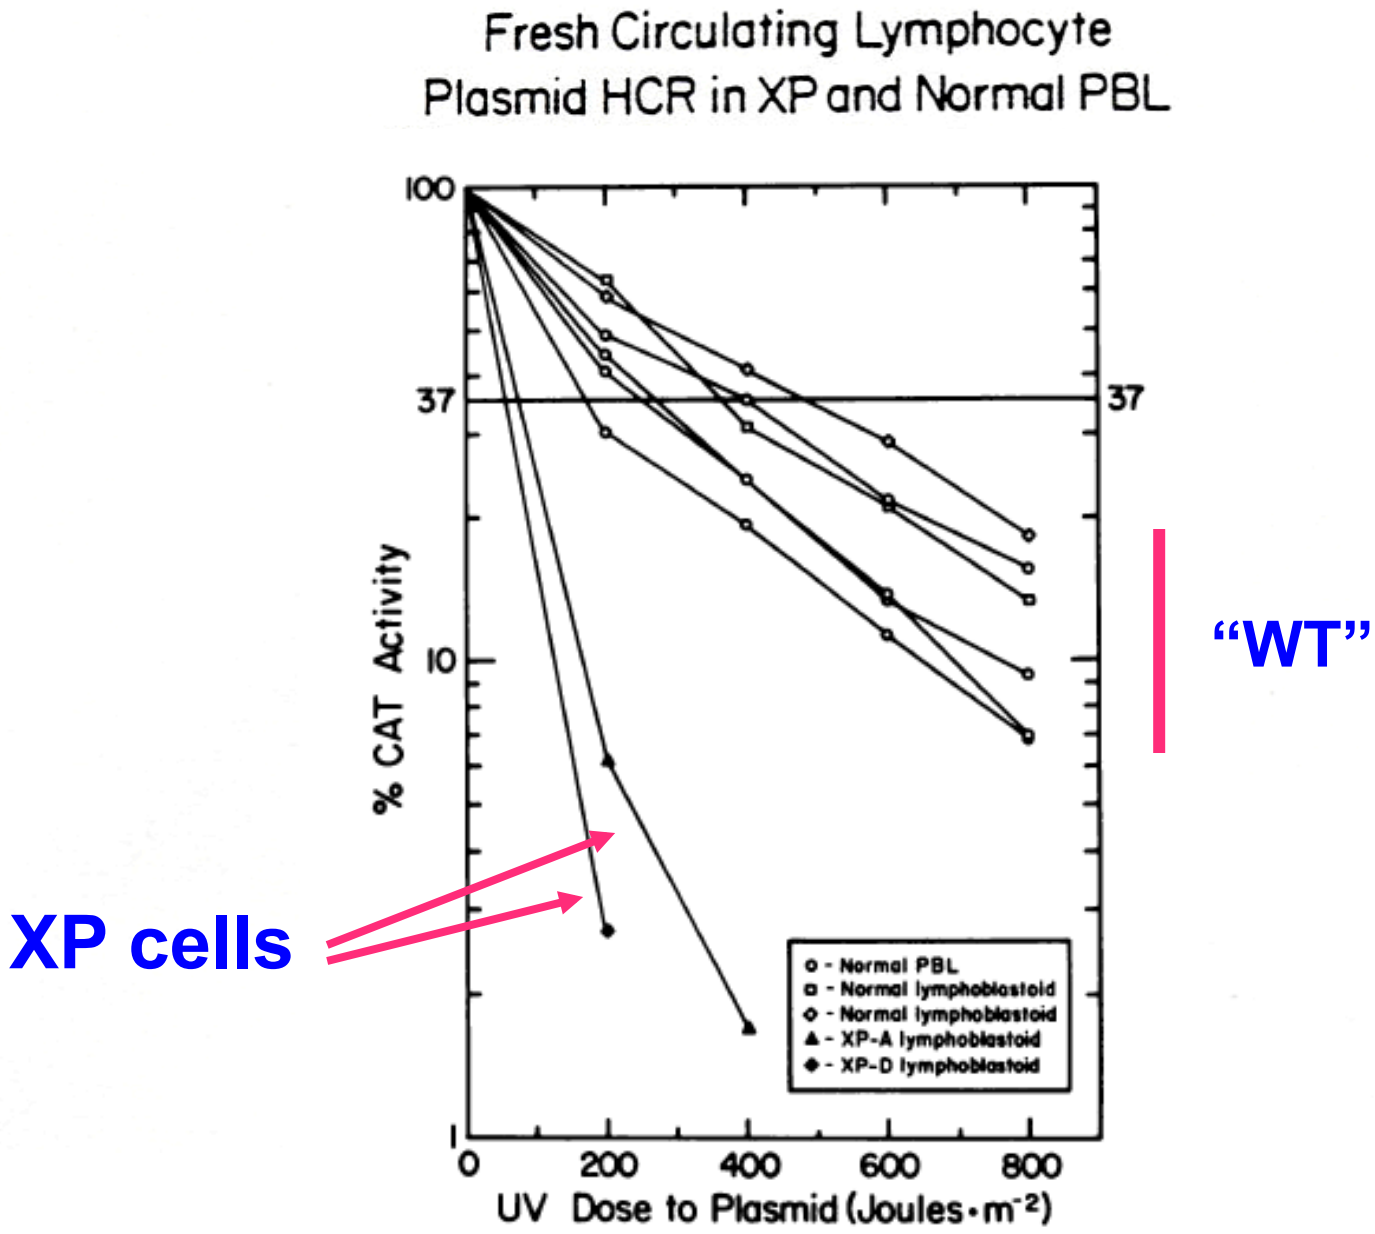






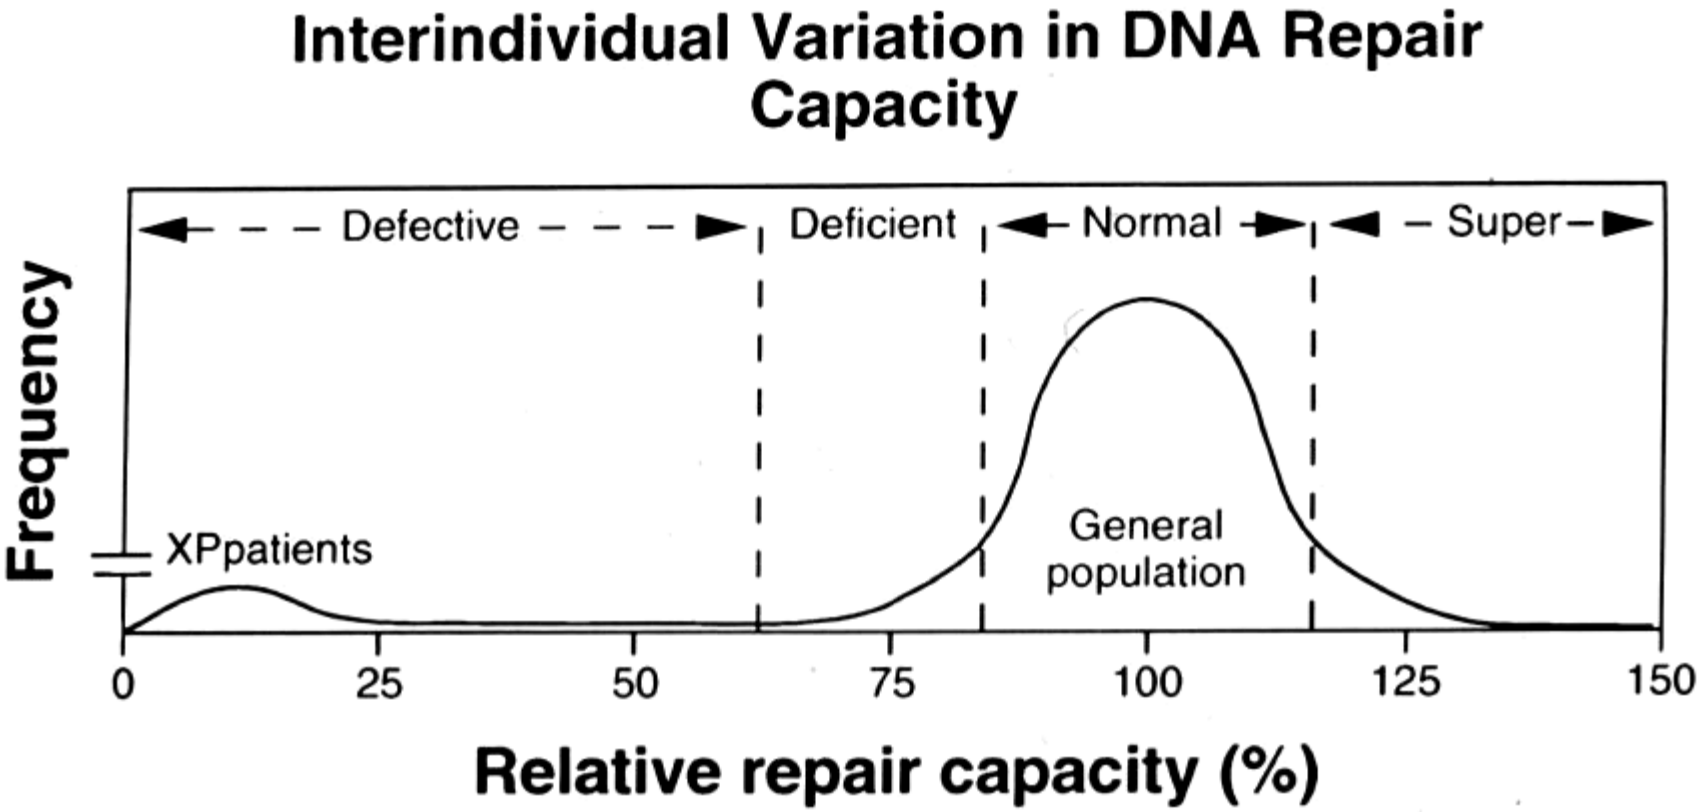
Time to repair

CAT Assay



Athas & GROSSMAN

[CANCER RESEARCH 51, 5786–5793, November 1, 1991]

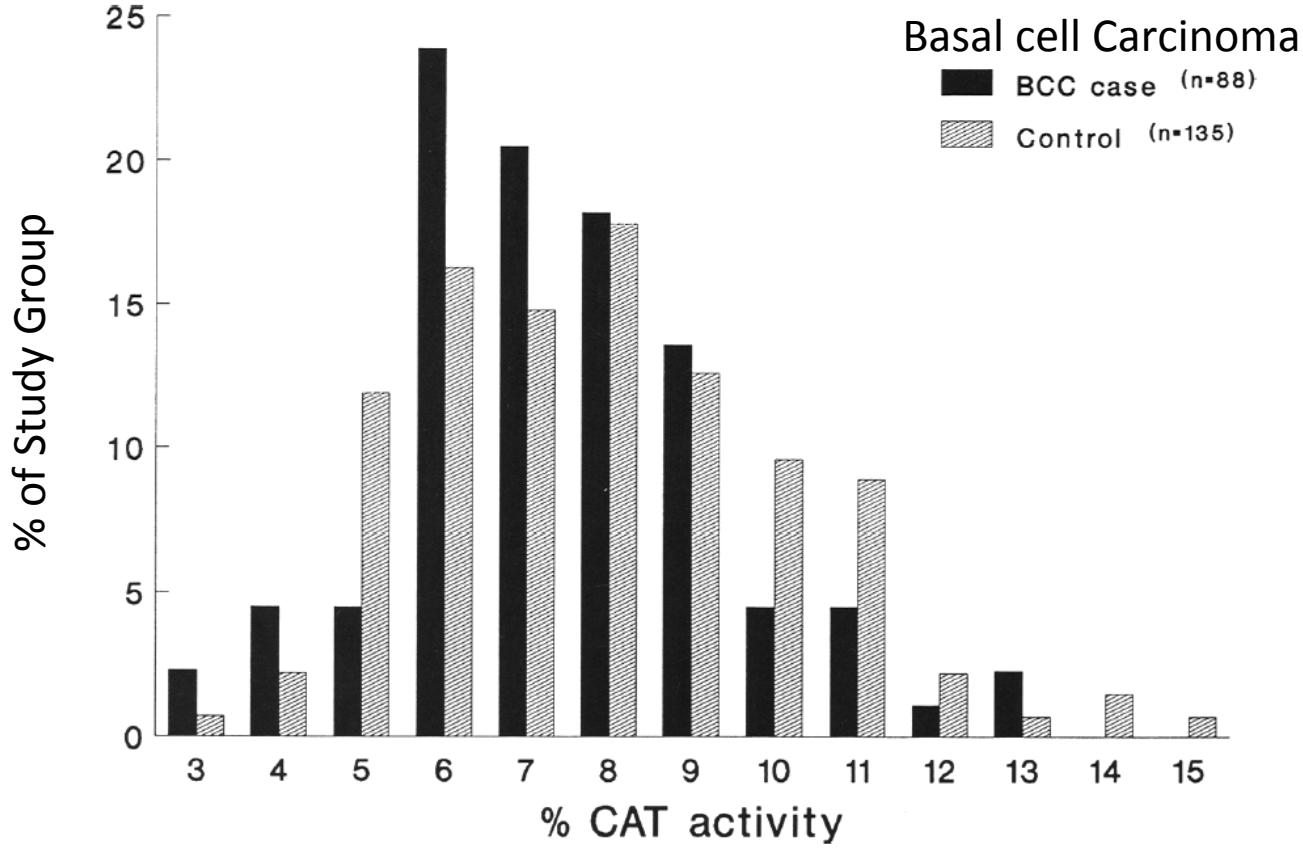


Adapted from **GROSSMAN and Wei (1995)** Clinical Chem 41: 1854-1863

XP frequency = ~1:250,000 giving theoretically ~28,000 cases worldwide with 2,000-fold increased skin cancer risk

Even if just 1% of the population is relatively repair deficient, could have tens of millions with several-fold increased risk

Case-Control Study monitoring DNA Repair Capacity (DRC) by Host Cell Reactivation (HCR) of plasmids containing DNA damage

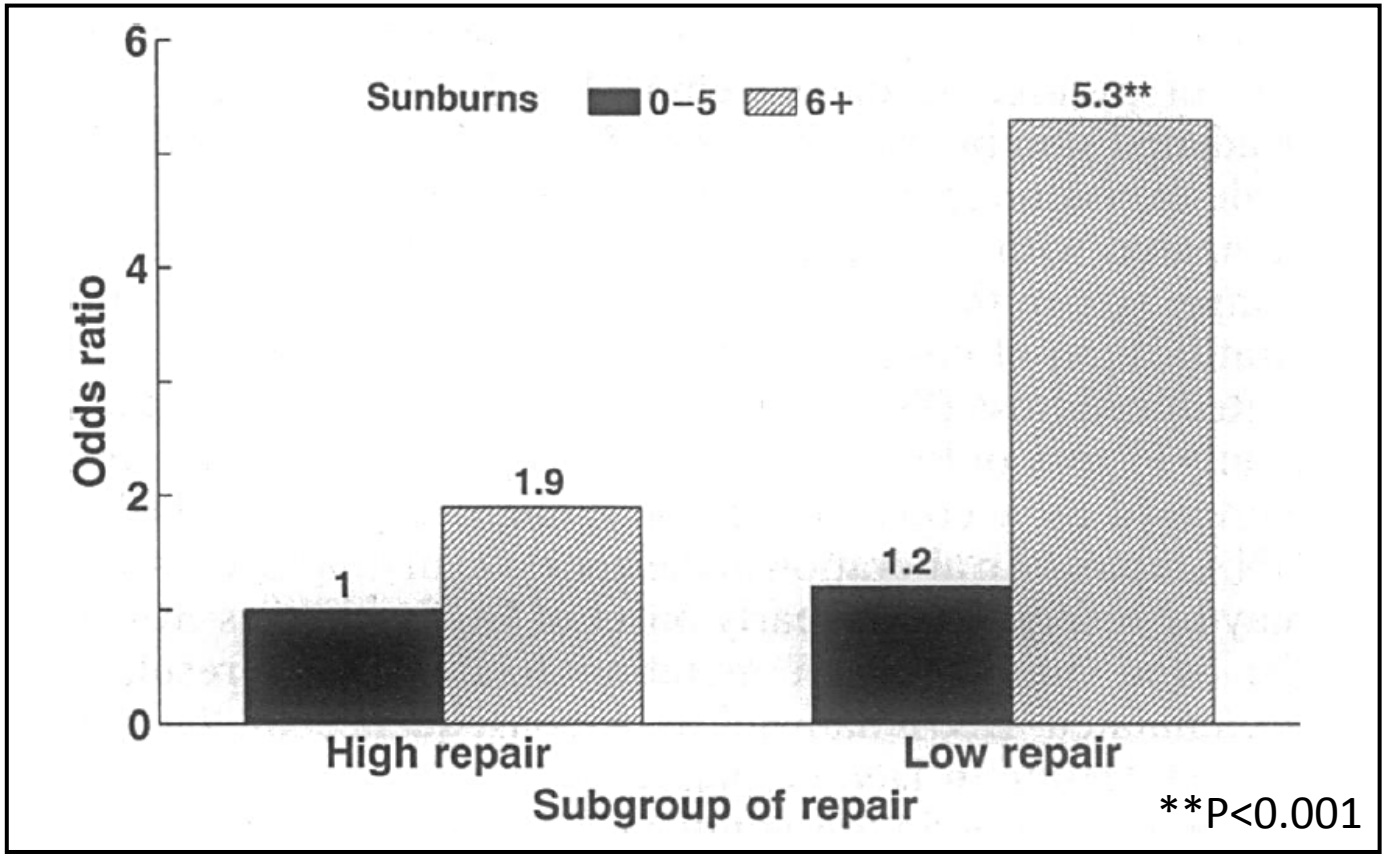


LOW Repair HIGH Repair

[CANCER RESEARCH 54, 437-44(i, January 15, 1994]

Qingyi Wei, Genevieve M. Matanoski, Evan R. Farmer, Mohammad A. Hedayati, and Lawrence GROSSMAN

Low NER Repair status combined with excessive sun exposure is very dangerous



Wei Q, Matanoski GM, Farmer ER, Hedayati MA, **GROSSMAN L.** Proc Natl Acad Sci U S A. 1993 90:1614-8.

Virtually all case/control HCR studies have monitored Nucleotide Excision Repair (NER)

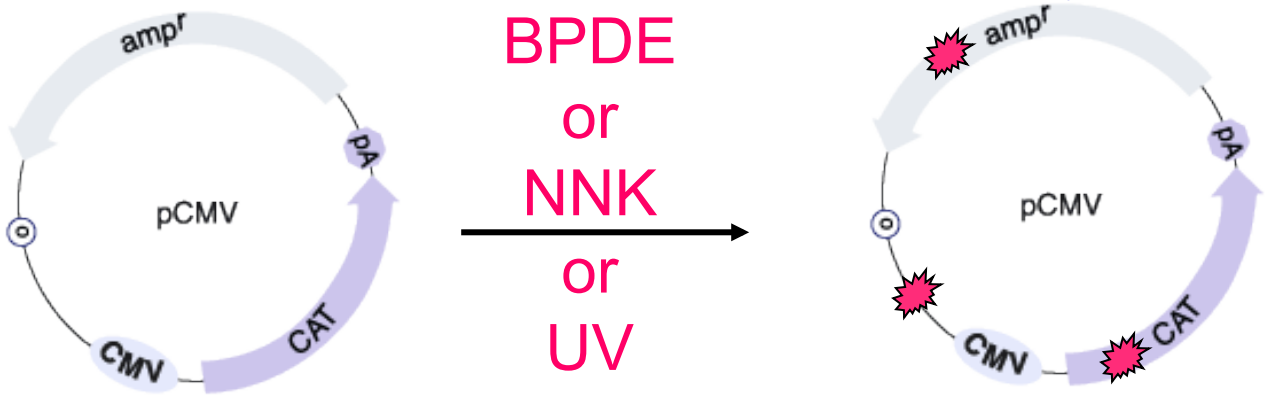


TABLE III – HCR-DRC FOR RISK OF CANCERS

Mutagen	Cancer type	Number Case/control	Risk estimate	Reference
BPDE	Lung	51/56	5.70 (2.10–15.7)	Wei *et al.* 1996[25]
	Lung, nonsmall cell	467/488	1.85 (1.42–2.42)	Shen *et al.* 2003 [58]
	Lung	764/677	1.50 (1.10–3.10)	Spitz *et al.* 2003[37]
	SCCHN	55/61	2.20 (1.02–4.77)	Cheng *et al.* 1998[61]
	Breast	69/79	3.36 (1.15–9.80)	Shi *et al.* 2004[64]
NNK	Lung, adenocarcinoma	48/45	3.21 (1.25–8.21)	Wang *et al.* 2007[59]
UV	BCC	146/333	1.62 (1.07–2.45)	Wang *et al.* 2007[63]
	SCC	109/333	1.63 (0.95–2.79)	
	CM	312/324	2.02 (1.45–2.82)	Wei *et al.* 2002[62]

BPDE, benzo(a)pyrene diol epoxide; UV, ultraviolet; SCCHN, squamous cell carcinoma of head and neck; BCC, basal cell carcinoma; SCC, squamous cell carcinoma; CM, cutaneous melanoma.

DNA lesions from an RNA polymerase perspective

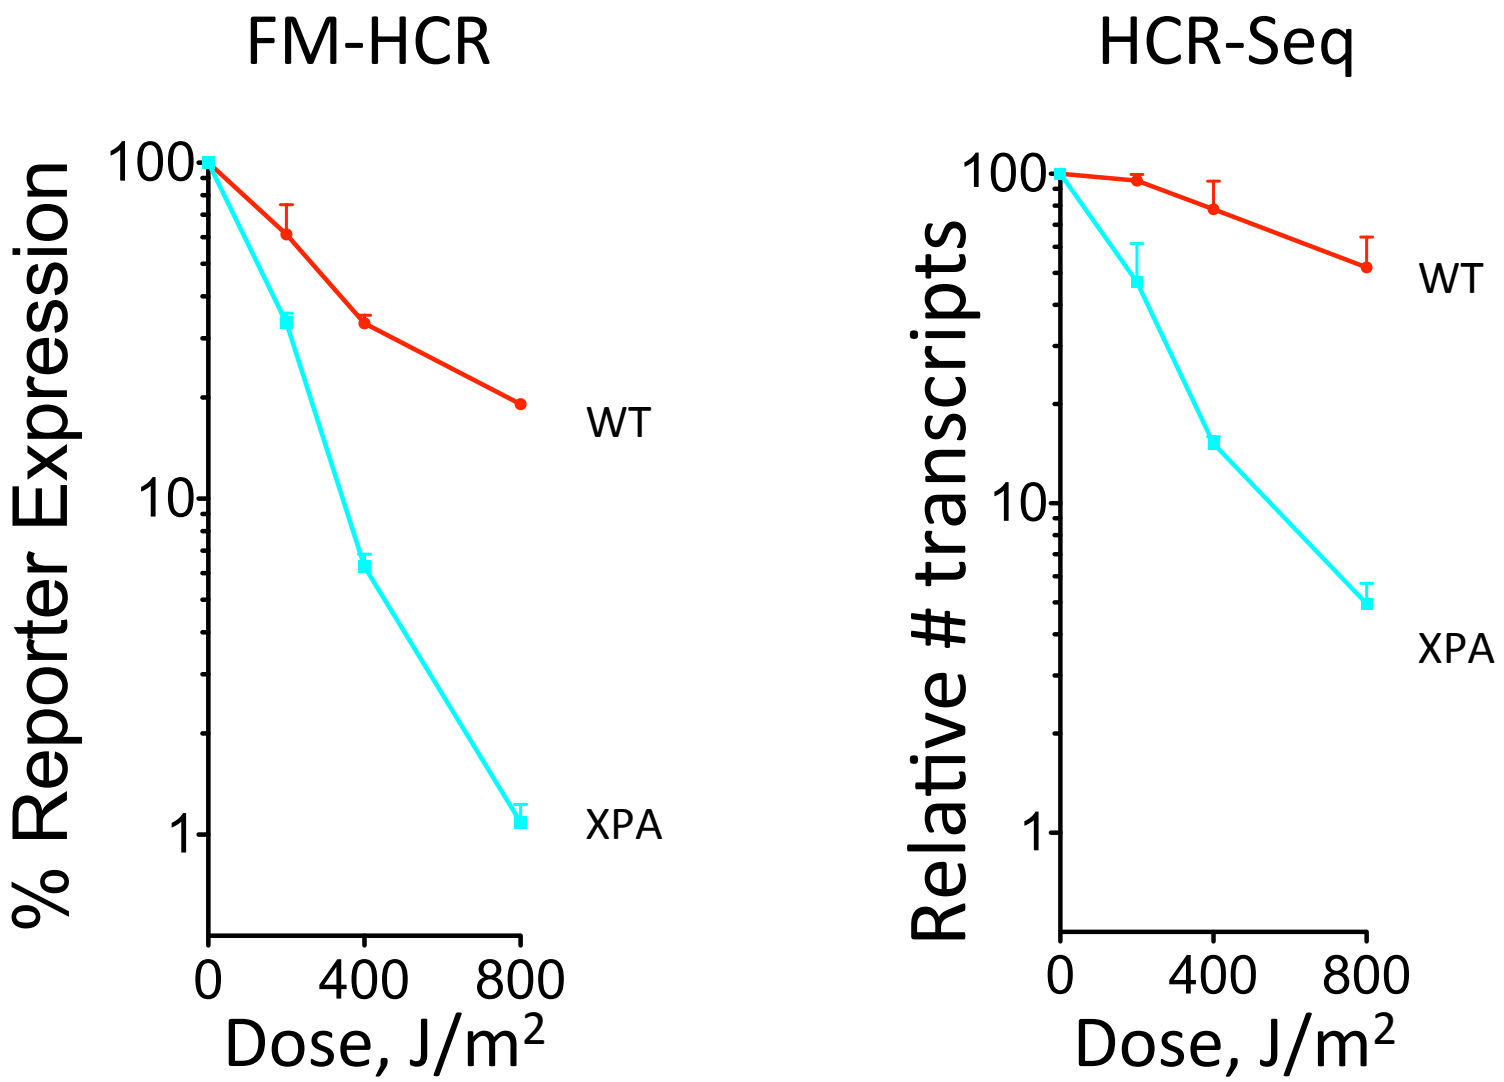
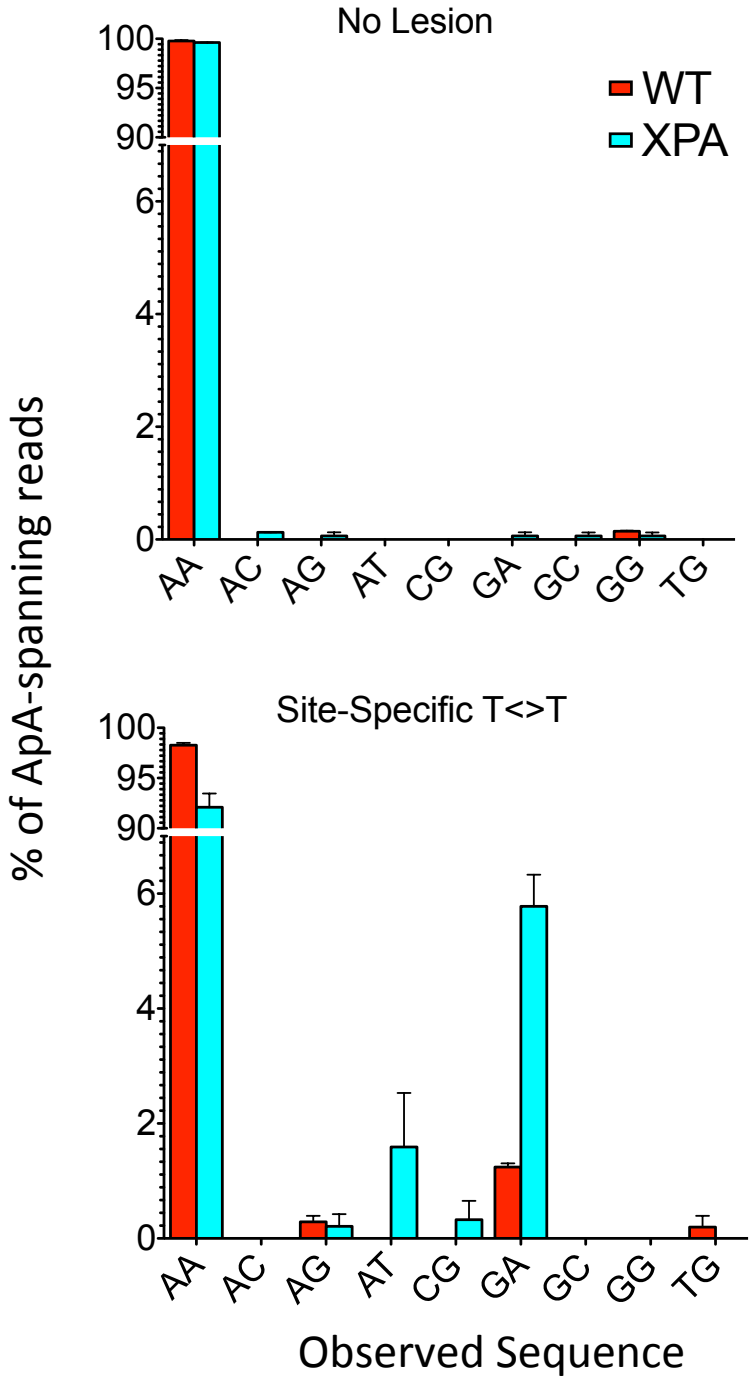
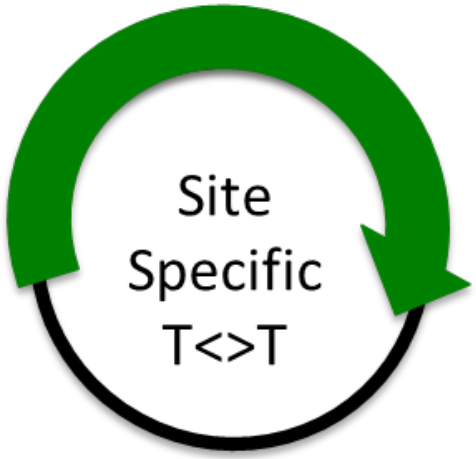
Dose-dependent reporter protein and reporter transcript expression from irradiated plasmids:

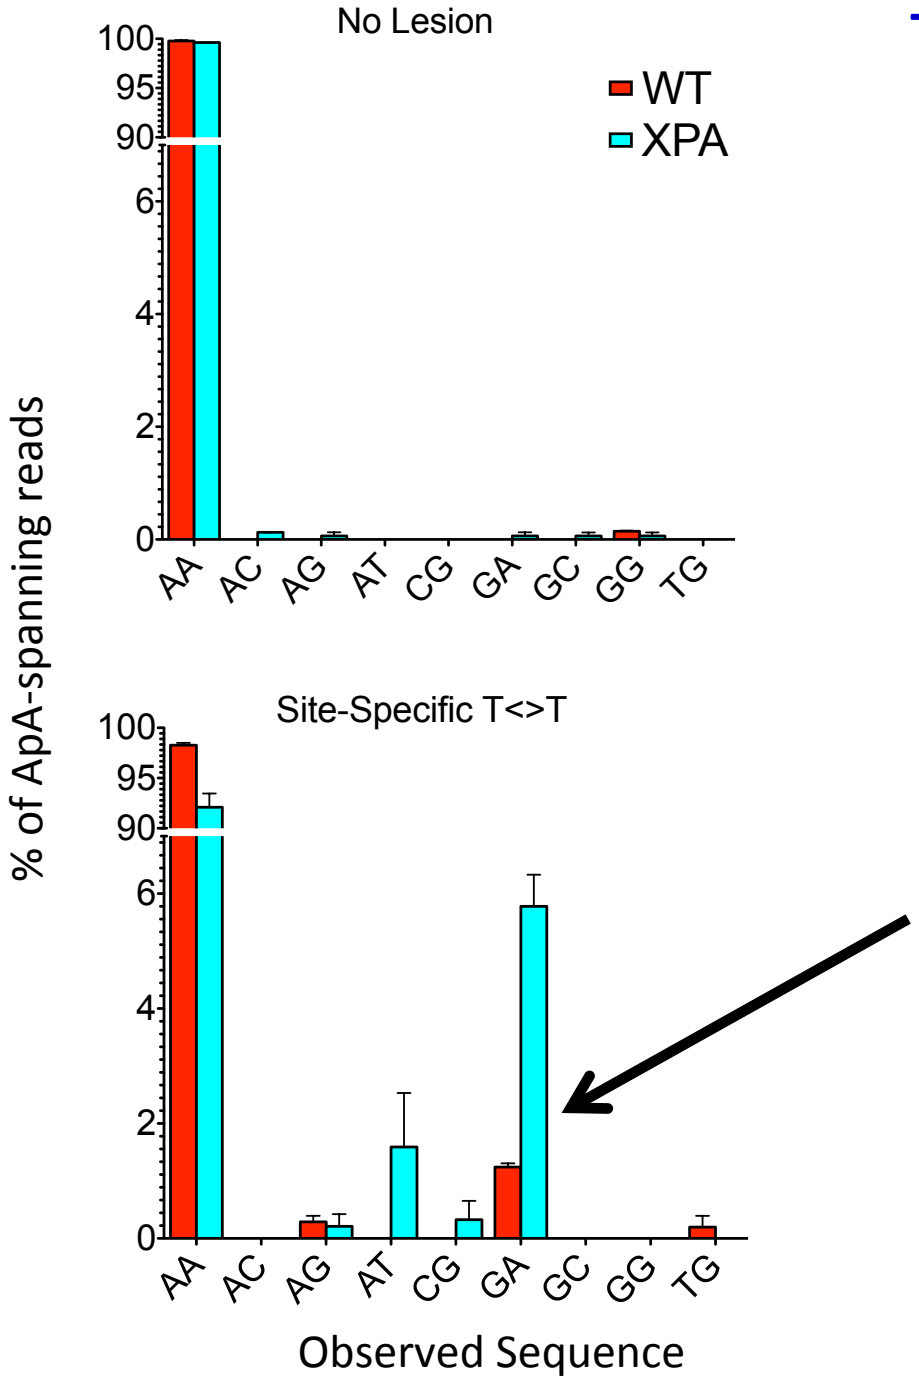


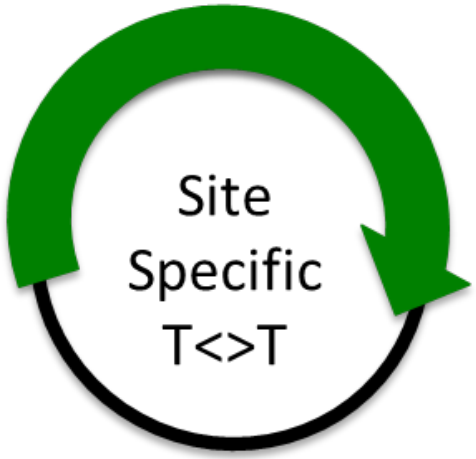


Transcriptional errors are induced by a site-specific thymine dimer



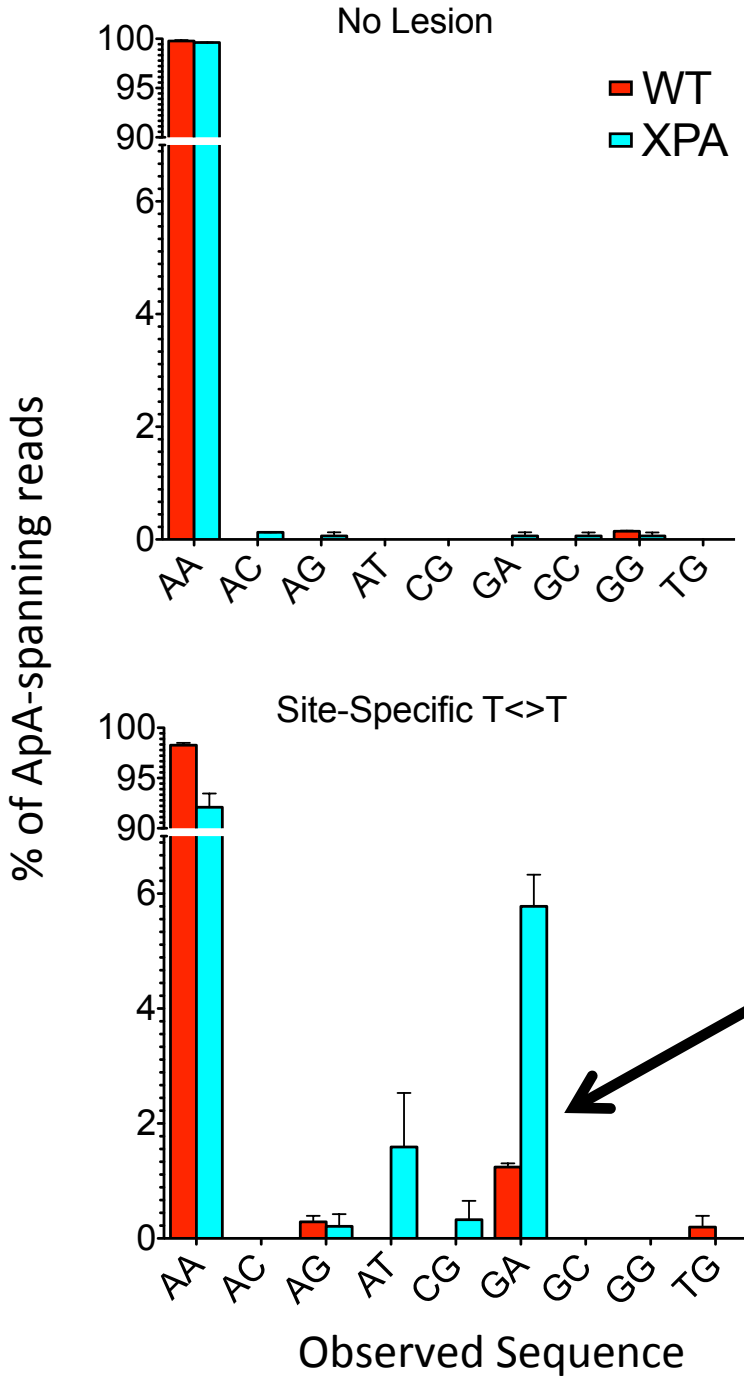
Transcriptional errors are induced by a site-specific thymine dimer

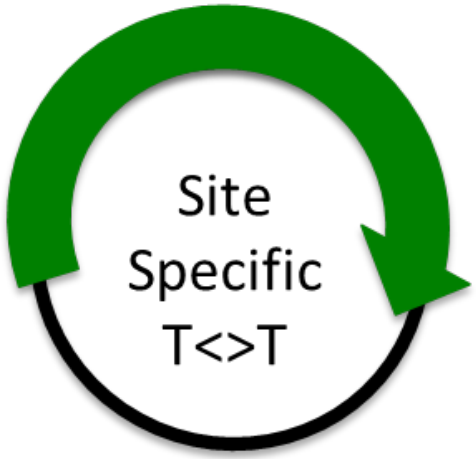




AA→GA was the most frequently observed sequence change

Transcriptional errors are induced by a site-specific thymine dimer





Transcriptional errors are more frequent in the NER-deficient XPA cells

Ultimately want to measure DRC for every major DNA repair activity in many different cell types – ideally derived from each individual
