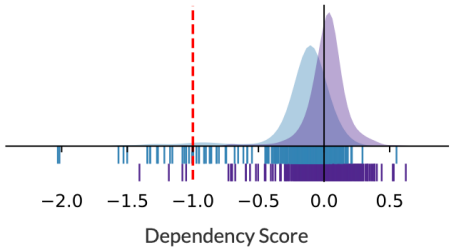
example query: IRF4

Overview | Dependency | Characterization | Description

Dependent Cell Lines

CRISPR: 42/558 STRONGLY SELECTIVE
RNAi: 11/711 STRONGLY SELECTIVE



Dependency Score: Outcome from DEMETER2 or CERES. A lower score means that a gene is more likely to be dependent in a given cell line. A score of 0 is equivalent to a gene that is not essential whereas a score of -1 corresponds to the median of all common essential genes.

Strongly Selective: A gene whose dependency is at least 100 times more likely to have been sampled from a skewed distribution than a normal distribution (i.e. skewed-LRT value > 100).

Stabilization of the Max Homodimer with a Small Molecule Attenuates Myc-Driven Transcription

Graphical Abstract

In Brief

Myc/Max-mediated transcription is deregulated in most of human cancers. Struntz et al. discovered a small molecule that stabilizes the Max homodimer and attenuates Myc-driven transcription with efficacy in cellular and murine cancer models. This discovery reinforces an alternative Myc-targeting strategy and could inform development of compounds to treat Myc-dependent cancers.

Highlights

- KI-MS2-008 is a Max-binding small molecule that attenuates Myc-driven transcription
- The compound stabilizes the Max homodimer
- Effects on DNA occupancy and the transcriptome resemble loss of Myc
- Treatment with KI-MS2-008 exhibits efficacy in cellular and murine cancer models

For future drug hunters – Lipinski's Rule of 5

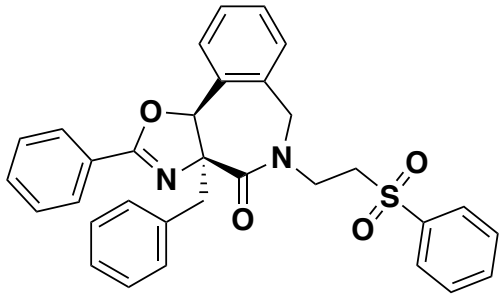
1997 - is a rule of thumb to evaluate 'drug-likeness' or determine if a chemical compound with a certain pharmacological or biological activity has chemical properties and physical properties that would make it a likely orally active drug in humans (Chris Lipinski, Pfizer)

MW < 500 Da
CLogP < 5
H-bond donor < 5
H-bond acceptor < 10

For future drug hunters – Lipinski's Rule of 5

1997 - is a rule of thumb to evaluate 'drug-likeness' or determine if a chemical compound with a certain pharmacological or biological activity has chemical properties and physical properties that would make it a likely orally active drug in humans (Chris Lipinski, Pfizer)

MW < 500 Da
CLogP < 5
H-bond donor < 5
H-bond acceptor < 10



MW = 536.65
ClogP = 6.38
H-bond donor = 0
H-bond acceptor = 4

Can we screen MAX against a new chemical library and find compounds with better physicochemical properties?

Can we find MAX binders with different modes of action?
