

M1D5:

Image Western blot of purified protein

1. Prelab discussion
2. *Complete western blot experiment – moved to Thursday!*
3. Prepare Data summary slide

And, thus, Ned learned the dangers of accessorizing with antibodies.

Overview of Mod 1 experiments:

Western blots probe for specific proteins

1

separate proteins using
electrophoresis

2

transfer proteins onto
nitrocellulose membrane

3

probe membrane using
antibodies

Let's review the separation and transfer steps...

Step 1: SDS-PAGE used to separate proteins into distinct bands

Step 2: Protein bands from polyacrylamide gel transferred to a nitrocellulose membrane via applying a current

- Why is it necessary to transfer proteins onto a membrane?

Step 3: probe membrane using antibodies

- Primary antibody raised against protein of interest to identify band that corresponds to specific protein on the blot
- Secondary antibody raised against the species of the primary antibody to visualize band that corresponds to specific protein of interest

What antibodies are we using?

- To probe for MAX...
 - 1° = rabbit α -MAX
 - 2° = donkey α -rabbit IR680
- To probe for 6xHis tag...
 - 1° = mouse α -His
 - 2° = goat α -mouse IR800

Antibodies used to detect specific protein

transfer proteins from polyacrylamide gel onto nitrocellulose membrane

- Which proteins are transferred to the membrane?

Antibodies used to detect specific protein

- How does blocking buffer prevent non-specific binding of antibodies?

Antibodies used to detect specific protein

incubate membrane with primary antibody specific to protein of interest

- Why are we using two primary antibodies? For what does each probe?

Antibodies used to detect specific protein

incubate membrane with secondary antibody
specific to constant region of primary antibody

- Why use secondary antibodies (rather than labeled primary antibodies)?

For today...

- Complete western blot staining & imaging
- During downtime, draft data summary slide for protein purity and concentration results with your partner
- Complete in-lab methods critique activity.

For M1D6...

- **With your laboratory partner**, draft methods section
- Submit write-up from meeting with Comm Lab fellow

Notes on methods section...

Include **enough information to replicate** the experiment

- Cite manufacturer for supplies / equipment (Company)
- Be concise and clear in your description

Use subsections with **descriptive titles**

- Put in logical order, rather than chronological order
- Begin with topic sentence to introduce purpose / goal of each experimental procedure

Use clear and concise **full sentences**

- NO tables or lists, all information should be provided in full sentences and paragraphs
- Write in passive voice and use past tense

Use the most **flexible units**

- Write concentrations (when known) rather than volumes

Eliminate 20.109 specific language and obvious details

- Example “labeled Row A, Row B...”
- Do not include details about tubes and water!
- Assume reader has some biology experience
- Include parts of the protocol that the teaching faculty completed, but do not say “completed by teaching faculty.”

How can you improve this example?

DNA was cut to check insert. Enzymes were used for single and double

digest then run on gel made by adding 1 g of agar to 100 mL of water.

Gel was imaged on a gel box.

How can you improve this example?

What DNA?
How much?

Consider more
specific language.

What insert?

Which enzymes? From where were
the enzymes acquired?

DNA was cut to check insert. Enzymes were used to cut DNA for

Specifically, why was this done?

Redundant

Provide details on how this was done.

Colloquial...use more scientific
language. Also, include details.

single and double digests then run on a gel made by adding

What does this mean?

Be mindful of the order of information and of
confusing sentence structure.

1 g of agar to 100 mL of water. Gel was imaged on the gel box.

Use the most flexible units / concise
description.

What else was needed
for imaging?

The?

What would be more
informative?

Edited example...

Confirmation digest of pET28a_MAX-6xHis

To confirm that MAX-6xHis was cloned into pET28a expression vector, a digest was completed. Restriction enzymes Abcl and Defl were used to digest W ng of pET28a-MAX-6xHis in single digests (only one enzyme added) and in a double digest (both enzymes added) using X U / uL of each enzyme and Y buffer (NEB). Digests were incubated at 37C for Z hrs. [Include gel electrophoresis details].
